"Delta 12 fatty acid desturase gene of Mortierella alpina.";
Submitted (SEP-2001) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Catalyzes the desaturation of oleic acid (delta9-18:1)
to linoleic acid (delta9, delta12-18:2).
-!- PARTHWAY: C20 polyunsaturated fatty acid biosynthesis.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- DOMAIN: The histidine box domains may contain the active site and/or be involved in metal ion binding.
-!- SIMILARITY: Belongs to the fatty acid desaturase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            10-OCT-2003 (Rel. 42, Created)

FUNCTION: Chloroplast omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron donor and to act on fatty acids esterified to galactchlipids, sulfolipids and phosphatidylglycerol. PATHWAY: Polyunsaturated fatty acid biosynthesis.
SUBCELULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).
DOMAIN: The histidine box domains may contain the active site and/or be involved in metal ion binding.
SIMILARITY: Belongs to the fatty acid desaturase family.

- FUNCTION: Chloroplast omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron donor and to act on fatty acids esterified to galactolipids, sulfollipids and phosphatidylglycerol.

- PACHWAY: Polyunsaturated fatty acid biosynthesis.

- SUBCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE).

- DOMAIN: The histidine box domains may contain the active site and/or be involved in metal ion binding.

In FUNCTION: Microsomal (ER) omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 18:3 fatty acids, important constituents of plant membranes. It is thought to use cytochrome b5 as an electron donor and to act on fatty acids esterified to phosphatidylcholine and, possibly, other

PATHMAY: Polyunsaturated fatty acid biosynthesis.

SUBCELLULAR LOCATION: Endoplasmic reticulum.

DOMAIN: The histidine box domains may contain the active and/or be involved in metal ion binding.

SIMILARITY: Belongs to the fatty acid desaturase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: ER (microsomal) omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 18:3 fatty acids, important constituents of plant membranes. It is thought to use cytochrome b5 as an electron donor and to act on fatty acids esterified to phosphatidylcholine and, possibly, other

It is thought to use ferredoxin as an electron donor and to act on fatty acids esterified to galactolipids, sulfolipids and phosphatidylglycerol PATHMAY: Polyunsaturated fatty acid biosynthesis. SUBCELLIULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE). SUBCELLIULAR SPECIFICITY: Most abundant in leaves and seedlings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: The histidine box domains may contain the active and/or be involved in metal ion binding. SIMILARITY: Belongs to the fatty acid desaturase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   European

"Cloning of higher plant omega-3 fatty acid desaturases.";

Plant Physiol. 103:467-476(1993)

-I- FUNCTION: Chloroplast omega-3 fatty acid desaturase introduces the

third double bond in the biosynthesis of 16:3 and 18:3 fatty

acids, important constituents of plant membranes. It is thought to

use ferredoxin as an electron donor and to act on fatty acids

esterified to galactolipids, sulfolipids and phosphatidylglycerol.

-i- PANTHWAY: Polyunsaturated fatty acid biosynthesis.
                                                                                                                                                                                                                                                                                    Omega-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: Chloroplast omega-3 fatty acid desaturase introduces the third double bond in the biosynthesis of 16:3 and 18:3 fatty acids, important constituents of plant membranes. It is thought to use ferredoxin as an electron domor and to act on fatty acids esterified to galactolipids, sulfolipids and phosphatidylglycerol. PATHMAY: Polyunsaturated fatty acid biosynthesis. SUBCCELLULAR LOCATION: CHLOROPLAST, MEMBRANE-BOUND (PROBABLE). INDUCTION: BY LOW TEMPERATURE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DOMAIN: The histidine box domains may contain the active and/or be involved in metal ion binding.
SIMILARITY: Belongs to the fatty acid desaturase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Res. 4:215-230(1997).

                                                                                                                                                                                                                                                                                                                                                       This DNA encodes the Crepis alpina delta 12 acetylenase. This is used in the production of acetylenic compounds. The process comprises treating C18 fatty acids having a double bond at position delta 12 with an acetylenase to form 12-ynoic acids. The acetylenic compounds can be produced by organisms such as oilseed plants, yeast and fungi which are transformed with this acetylenase DNA. These organisms can accumulate these acetylenic compounds which are chemical feedstocks, particularly for coatings, plasticisers and lubricants. The process enables the production of these acetylenic compounds from a renewable resource with high purity and at reasonable cost. (Updated on 25-MAR-2003 to correct field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bafor M,

                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                              US-10-069-772-2 (1-377) x AAV63102
                                                                                                                                                                                                                                                                                                                                                                                                                                                 This cDNA clone, designated CrepX, codes for a novel epoxygenase (see AAW79743) of a Crepis sp. (not Crepis palaestina) that has a high CC vernolic acid content. The CrepX gene shows a high degree of homology to the novel Cpal1 delta-12-epoxygenase gene (see AAV3101) of C.

CC palaestina. CrepX cDNA was isolated from a Crepis sp. cDNA library using C crepis alpina acetylenase partial gene sequence (see AAV63101) as grobe. The invention relates generally to novel genetic sequences (see CC AAV63101-03) encoding fatty acid epoxygenases (see AAW79742-44), especially delta-12-epoxygenases or mixed function monooxygenases. These CC especially delta-12-epoxygenases or mixed function monooxygenases. These CC especially oilseed plants such as flax), in particular to convert unsaturated fatty acids to epoxygenated fatty acids. The invention extends to genetically modified oil-accumulating organisms and to the coils derived from them. These oils can be used in production of coatings, cresins, glues, plastics, surfactants or lubricants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      15-APR-1997;

It was isolated CC from a C. palaestina cDNA library using a Crepis alpina acetylenase CC partial gene sequence (see AAV63104) as probe. The encoded protein CC contains His-rich motifs (see AAW79752-54) that are characteristic of CC mixed function monoxygenases. The Cpa12 gene was shown to be highly CC expressed in developing seeds, with no expression detectable in leaves. CC The invention relates generally to novel genetic sequences (see AAV63101-CC 03) encoding fatty acid epoxygenases (see AAW79742-44), especially delta-CC 12-epoxygenases or mixed function monooxygenases. These provide the means by which fatty acid metabolism can be manipulated in e.g. yeast, mould, CC bacteria, insects, birds, mammals and plants (especially oilseed plants CC such as flax), in particular to convert unsaturated fatty acids to CC epoxygenated fatty acids. The invention extends to genetically modified CC oil-accumulating organisms and to the oils derived from them. These oils can be used in production of coatings, resins, glues, plastics, cx surfactants or lubricants

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence encodes Vernonia galamenensis fatty acid epoxidising enzyme. The present invention also describes: (i) Vernonia galamenensis fatty acid desaturase; (ii) chimeric genes comprising the fragments linked to regulatory sequences; and (iii) transformed host cells containing the chimeric genes. The DNA's from the present invention can be used to alter levels of expression of the enzymes in transformed host cells or to produce the recombinant enzymes by transformation of microbial host cells. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                         US-10-069-772-2 (1-377) x ADE40488
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel nucleic acid encoding a polypeptide with desaturase activity. The products of the invention are used in the construction of constructs, vectors, organisms and transgenic plants containing the desaturase. The invention also describes methods for preparing oils or triglycerides with increased content of unsaturated fatty acids; oils fats and fatty acid mixtures and a novel nucleic acid encoding a protein able to convert a fatty acid to a more highly unsaturated acid. The products of the invention are used to produce transgenic plants (or other organisms) that produce oils and fats with increased contents of unsaturated fatty acids, useful in preparation of foods, animal feeds, cosmetics and pharmaceuticals and in homology screening for isolation of genomic sequences. This sequence encodes a fragment of the Punica granatum (pomegranate) delta-12-desaturase PuFADI2 described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1398 BP; 311 A; 422 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                   No.:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20-JUL-2001; 2001DB-01034660

                                                                                                                                                                                                                                                                           US-10-069-772-2 (1-377) x AAD22380
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method for modifying the endogenous oil of a cotton plant, to produce cotton seed oil. The method comprises producing a transgenic cotton plant having a gene construct which includes a fatty acid biosynthesis gene operably linked to a promoter sequence capable of conferring expression of the delta9-desaturase (delta9 stearoyl-ACP desaturase) gene, or fatty acid delta12-desaturase (oleoyl-PC delta12-desaturase) gene in the seed of a cotton plant. The invention is useful for producing cottonseed oil with reduced palmitic and/or lincleic acid content, and increased stearic and/or oleic acid content. The present sequence is cotton oleyyl-PC delta12-desaturase (ghFAD2-2) protein cDNA sequence is cotton oleyyl-PC delta12-desaturase (ghFAD2-2)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modifying endogenous oil of cotton plants, to produce cotton seed oil with reduced palmitic and/or linoleic acid content, involves producing transgenic plants containing a fatty acid biosynthesis gene in a

The products of the invention can be used for the large scale production of conjugated linoleic acids. The composition may be used for cosmectic or pharmaceutical purposes. The conjugated linoleic acids may be used for coating, painting or cold weather ester-type lubricant purposes. There not a natural source which is rich in conjugated linoleic acids and chemical processes result in a mixture of several isomers. Plant biotechnology is cost-effective and renewable with little side effects. This sequence encodes the Calendula officinalis CoFad2 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids which encode a conjugase and its related enzyme a de desaturase to be used for the large scale production of conjugated linoleic acid and linolenic acid in plants.

                                                                                                                                                                                                                                                                                                                                                                                             Percent Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to Brassica plants containing recombinant nucleic acid constructs comprising (a) a wild-type microsmal Delta-12 fatty acid desaturase (Fad2) coding sequence linked to a regulatory sequence and (b a wild-type microsmal Delta-15 fatty acid desaturase (Fad3) coding sequence linked to a regulatory sequence. The plants exhibit a seed-specific reduction in native Fad2 and Fad3 gene expression. The plant produces seeds yielding an oil whose fatty acids comprise at least 86 percent oleic acid and less than 2 percent erucic acid. The plants are used to produce cannola (rapeseed) oil having a high oleic acid content, low erucic acid content, a low alpha-linolenic acid content and high oxidative stability. The present sequence represents the coding sequence of the F form of the wild-type Fad2 gene
                                                                                                                                                                                                                                                                                                                                                                                   Local Similarity:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to fatty acid desaturases (FAD) from Brassicaceae or Helianthus, where the FAD genes comprise at least one mutation in their sequences. The mutation is in a region encoding the His-Xaa-Xaa-Xaa-His motif of the delta-12 or delta-15 fatty acid desaturases. The invention also provides methods for producing the FAD mutant genes and gene products. The products can be used for producing plants and seeds which have altered fatty acid compositions, e.g. an elevated oleic acid content, a decreased, stabilised linoleic acid content, both elevated oleic acid and decreased, stabilised linoleic acid content or a decreased, stabilised linoleic acid and increased level of linoleic acid and increased level of linoleic acid. The plants may be e.g. soybean, rapeseed, sunflower, safflower, castor bean or corn. The present sequence represents the DNA sequence of the coding region of the Brassica wild-type Fad2-F gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        monounsaturated fatty acid (FA) content of at least 82% and an erucic acid content of at least 15% based on total FA composition. The patent further relates to genes encoding delta-12 and delta-15 fatty acid desaturases (Fad2 and Fad3 respectively). Mutations in these genes result in useful alterations in the fatty acid compositions of the seed oil e.g. mutation in Fad2 gene confers elevated oleic acid content and decreased linoleic acid content. The Brassica seeds are useful source for vegetable oil and industrial oils such as engine lubricants, transmission fluids for diesel engines and hydraulic oil. The present sequence is that of a wild type gene encoding Brassica napus microsomal Delta-12 fatty acid desaturase-F (Fad2-F)
